Neokiss Annual Report Introduction

Introduction

Preterm infants are at high risk for nosocomial infection rates. Audit and feedback can produce improvement in clinical practices. The national Belgian benchmarking database on preterm infants has included the NeoKiss protocol for infection surveillance with standardized definitions.

Surveillance population criteria: all patients with a birthweight of less than 1500g

Hospital acquired infection criteria: neonatal infections are considered nosocomial when occurring 72 hours after birth.

Tables and graphs are displayed for each individual unit (Nic number) and compared with the entire population (reference).

The reference for a particular indicator is calculated by considering all units as one.

For each indicator results are given as:

- Mean and 95 % CI (confidence interval)
- Median P50(Q1-Q3) (interquartile range) and range

Separate calculations are given for the entire population (overall) and stratified in birthweight categories "500g, 500-999g, 1000-1499g".
